Team reflection sprint 3

A. The current situation or "what is" (A),
B. What you want the situation to be or "what might or should be" (B), and
C. A plan for getting from where you are to where you want to be or "feedback designed to reduce the gap" (A -> B).

Customer Value and Scope

A. We have a good understanding of which parts of our product are valuable to the stakeholder, but have not complemented the DoD with the new priorities. We have prioritized user stories in accordance with the values defined by the stakeholders. We have begun assigning effort estimates to user stories.
B. We want a clear DoD. And better estimations of efforts required for completing user stories.
C. Take time out of our schedules to create a clear DoD. The estimations will be calibrated during the duration of the project.

Design decisions and product structure

A. We have no UML-diagrams or documentation. We have chosen to use react front-end with a Java/spring-boot backend. We have used OOP principles as widely as possible.
B. We want our code to be documented for sustainability. We need a UML or a sequence diagram for documentation and development purposes
C. We will take a meeting to discuss the current structure of the program, and outline how the structure should look/evolve to follow coding standards.
